

# Git Cheat Sheet

<http://git.or.cz/>

Remember: `git command --help`

Global Git configuration is stored in `$HOME/.gitconfig` (`git config --help`)

## Create

From existing data

```
cd ~/projects/myproject  
git init  
git add .
```

From existing repo

```
git clone ~/existing/repo ~/new/repo  
git clone git://host.org/project.git  
git clone ssh://you@host.org/proj.git
```

## Show

Files changed in working directory

```
git status
```

Changes to tracked files

```
git diff
```

What changed between \$ID1 and \$ID2

```
git diff $id1 $id2
```

History of changes

```
git log
```

History of changes for file with diffs

```
git log -p $file $dir/ec/tory
```

Who changed what and when in a file

```
git blame $file
```

A commit identified by \$ID

```
git show $id
```

A specific file from a specific \$ID

```
git show $id:$file
```

All local branches

```
git branch
```

(star '\*' marks the current branch)

## Cheat Sheet Notation

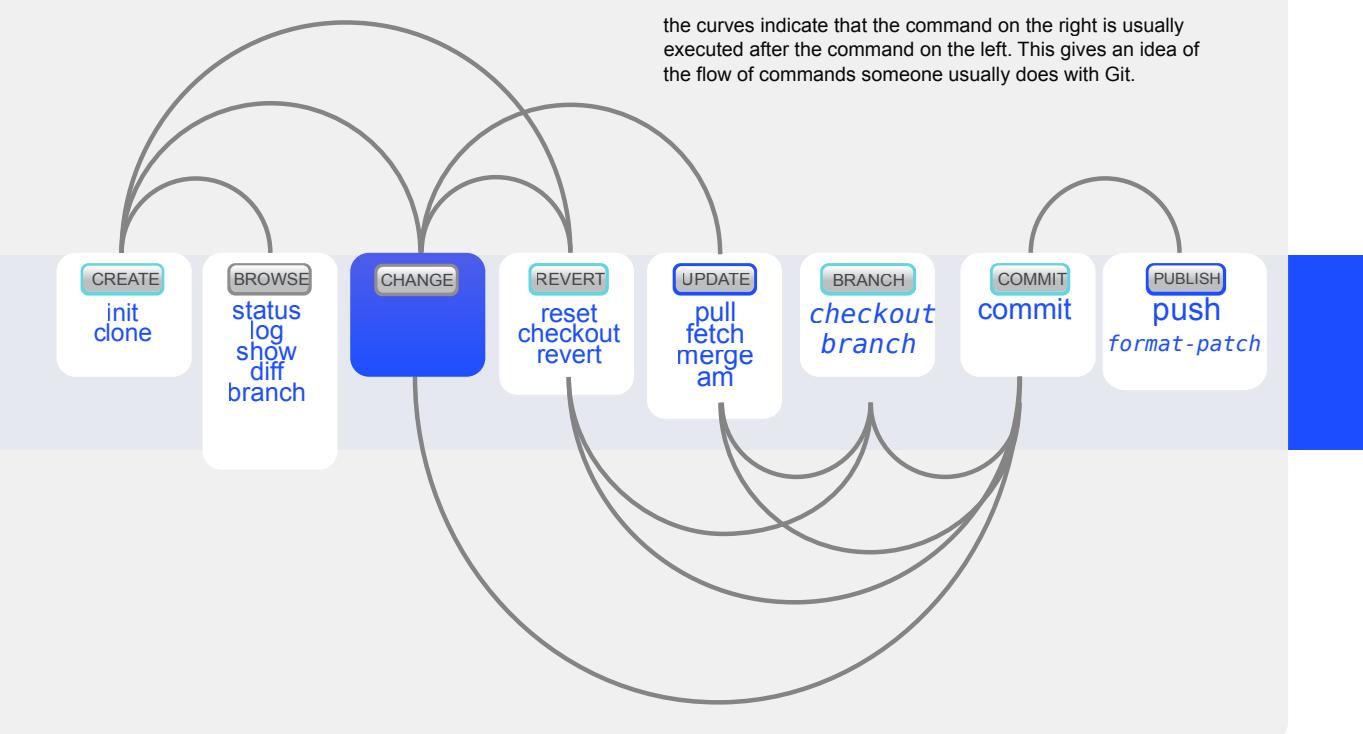

\$id : notation used in this sheet to represent either a commit id, branch or a tag name

\$file : arbitrary file name

\$branch : arbitrary branch name

## Commands Sequence

the curves indicate that the command on the right is usually executed after the command on the left. This gives an idea of the flow of commands someone usually does with Git.

## Concepts

### Git Basics

master : default development branch  
origin : default upstream repository  
HEAD : current branch  
HEAD^ : parent of HEAD  
HEAD~4 : the great-great grandparent of HEAD

### Revert

Return to the last committed state

```
git reset --hard
```

⚠ you cannot undo a hard reset

Revert the last commit

```
git revert HEAD
```

Creates a new commit

Revert specific commit

```
git revert $id
```

Creates a new commit

Fix the last commit

```
git commit -a --amend
```

(after editing the broken files)

Checkout the \$id version of a file

```
git checkout $id $file
```

### Branch

Switch to the \$id branch

```
git checkout $id
```

Merge branch1 into branch2

```
git checkout $branch2
```

```
git merge branch1
```

Create branch named \$branch based on the HEAD

```
git branch $branch
```

Create branch \$new\_branch based on branch \$other and switch to it

```
git checkout -b $new_branch $other
```

Delete branch \$branch

```
git branch -d $branch
```

## Useful Commands

### Finding regressions

```
git bisect start  
git bisect good $id  
git bisect bad $id
```

(to start)  
(\$id is the last working version)  
(\$id is a broken version)

```
git bisect bad/good  
git bisect visualize  
git bisect reset
```

(to mark it as bad or good)  
(to launch gitk and mark it)  
(once you're done)

Check for errors and cleanup repository

```
git fsck  
git gc --prune
```

Search working directory for foo()

```
git grep "foo()"
```

## Publish

Commit all your local changes

```
git commit -a
```

Prepare a patch for other developers

```
git format-patch origin
```

Push changes to origin

```
git push
```

Mark a version / milestone

```
git tag v1.0
```

## Resolve Merge Conflicts

### To view the merge conflicts

```
git diff  
git diff --base $file  
git diff --ours $file  
git diff --theirs $file
```

(complete conflict diff)  
(against base file)  
(against your changes)  
(against other changes)

To discard conflicting patch

```
git reset --hard  
git rebase --skip
```

After resolving conflicts, merge with

```
git add $conflicting_file  
git rebase --continue
```

(do for all resolved files)
